SOUTH DAKOTA STATEWIDE FISHERIES SURVEY

2102-F-21-R-42

Name: Lake Herman County: Lake

Legal Description: T106N- R53W- Sec.10-11,14-15, 22-23 **Location from nearest town**: 2 miles west of Madison, SD.

Dates of present survey: June 15-17, 2009, September 10, 2009 (electrofishing) **Dates of last survey**: June 18-20, 2007, September 18, 2007 (electrofishing)

Most recent lake management plan: F-21-R-28 (January 1, 1995-December 31, 1999)

Management classification: Warmwater Marginal

| Primary Game and Forage Species | Secondary and Other Species |
|---------------------------------|-----------------------------|
| Walleye | Northern Pike |
| Yellow Perch | Common Carp |
| Black Crappie | Bluegill |
| Black Bullhead | White Sucker |
| | Bigmouth Buffalo |
| | White Bass |

PHYSICAL DATA

Surface area when full: 1,287 acres

Maximum depth when full: 13 feet

Watershed area: 36,275 acres

Mean depth when full: 4.7 feet

Lake elevation observed during the survey: Full

Ordinary high water mark elevation: 1,669.0

Outlet elevation: 1,668.4

Contour map available? Yes

Date set: October, 1981

Date set: October, 1981

Date prepared: 2002

Beneficial use classification(s): (6) warmwater semipermanent fish propagation and irrigation (7) immersion recreation, (8) limited-contact recreation, (9) fish and wildlife

propagation and stock watering.

Ownership of Lake and Adjacent Lakeshore Properties

Lake Herman is listed as a meandered public water in the State of South Dakota Listing of Meandered Lakes. The South Dakota Department of Game, Fish, and Parks (GFP) owns and manages a State Park on the east side of the lake and a Lake Access Area on the west side. The remainder of the shoreline is privately owned and heavily developed.

Fishing Access

Lake Herman State Park contains a double lane boat ramp with a dock, picnic tables, comfort stations, full service and primitive campgrounds. There are many areas suitable for shore fishing. The West Lake Access Area contains a single lane boat ramp with a dock and a public toilet. Shoreline access is limited.

Field Observations of Water Quality and Aquatic Vegetation

The water in Lake Herman was more clear than usual with a Secchi depth measurement of 1.5 meters (59 inches). Very little submerged vegetation was present but some common cattail can be found in the northwest and south bays.

BIOLOGICAL DATA

Methods:

Lake Herman was sampled on June 15-17, 2009 with three overnight gill-net sets and nine overnight trap-net sets. The trap nets are constructed with 19-mm-bar-mesh ($\frac{3}{4}$ in) netting, 0.9 m high x 1.5 m wide (3 ft high x 5 ft wide) frames and 18.3 m (60 ft) long leads. The gill nets are 45.7 m long x 1.8 m deep (150 ft long x 6 ft deep) with one 7.6 m (25 ft) panel each of 13, 19, 25, 32, 38 and 51-mm-bar-mesh ($\frac{1}{2}$, $\frac{3}{4}$, 1, 1 $\frac{1}{4}$, 1 $\frac{1}{2}$, and 2 in) monofilament netting. Two hours of nighttime electrofishing were done on September 10, 2009 to evaluate walleye recruitment. Sampling locations are displayed in Figure 5.

Results and Discussion:

Gill Net Catch

The gill-net catch was comprised mostly of white suckers (34.1%), yellow perch (33.3%) and black bullhead (13.6%) (Table 1). White bass, walleye, northern pike, and channel catfish were also sampled.

Table 1. Total catch from three overnight gill net sets at Lake Herman, Lake County June 18-20, 2009.

| Species | # | Percent | CPUE ¹ | 80% C.I. | Mean CPUE* | PSD | RSD-P | Mean Wr |

Length categories can be found in Appendix A.

Trap Net Catch

Black bullhead dominated the trap-net catch (82.2%, Table 3). Nine other fish species were also sampled.

Table 3. Total catch from ten overnight trap net sets at Lake Herman, Lake County, June 15-17, 2009.

| Species | Number | Percent | CPUE | 80% C.I. | Mean CPUE* | PSD | RSD-P | Mean Wr |

Length categories can be found in Appendix A.

Walleye

Management objective: Maintain a walleye population with a gill-net CPUE of at least 15, a PSD range of 30-60, and a growth rate of 14 inches by age-3.

Walleye gill-net CPUE has steadily declined since 2003 (Table 5) and is well below the management objective. Most sampled fish were from the fry-stocked 2005 year class (Table 6) and averaged 433 mm (17.0 inches; Figure 1) in length.

Table 5. Walleye gill-net CPUE, PSD, RSD-P, and mean Wr for Lake Herman, Lake County, 2001-2009.

| (50) | (4) | (4) | (37) | (5) | | | | | | | | |

A weak walleye year class was naturally-produced in 2009(Table 7). The size of age-0 walleyes improved from preceding years, although the condition of the fish is still relatively poor. Age-1 walleye were present indicating some survival of small walleyes from the 2008 year class. Age-1 walleyes were still small for their age, and their condition was poor.

Table 7. Age-0 and age-1 walleyes sampled by nighttime electrofishing on Lake Herman, Lake County, 1996-2009.

| | | Age-0 | 80% | % | Mean length | | Age-1 | 80% | Mean length | |

No evaluation done.

Yellow Perch

Management objective: Maintain a gill-net CPUE of at least 50 with a PSD range of 30-60.

Yellow perch gill net CPUE increased from 2007 but remains below the management objective (Table 8). Recruitment has been very low for several years, a common occurrence on many Region III lakes. The perch sampled ranged in length from 170 –230 mm (6.7–9.1 in) (Figure 2) and were in very good condition with a mean Wr of 106 (Table 8). Yellow perch fry (7,539,000) were stocked in spring 2009 but we did not sample any Age-0 yellow perch seining in August or electrofishing later in the fall.

Table 8. Yellow perch gill-net CPUE, PSD, RSD-P, and mean Wr for Lake Herman, Lake County, 2001-2009.

| | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | Mean* |

^{*5} years (1999, 2001, 2003, 2005, 2007)

Black Crappie

Management objective: Maintain a black crappie fishery with a trap net CPUE of at least 20 and PSD of at least 40.

Black crappie trap net CPUE in 2009 declined from 2007 with only one fish sampled (Table 9) (Figure 3).

² OTC marks were faint; and therefore, I had difficulty discerning marked from unmarked fish. I believe that there was a greater likelihood of incorrectly identifying marked individuals as unmarked rather than unmarked fish as marked.

Table 9. Black crappie trap-net CPUE, PSD, RSD-P, and mean Wr for Lake Herman, Lake County, 2001-2009.

^{*5} years (1999, 2001, 2003, 2005, 2007)

Black Bullhead

Management objective: Maintain a black bullhead population with a trap-net net CPUE of no more than 100.

Black bullhead trap net CPUE increased again in 2009 (Table 10), and is now above the management objective. Several year classes and a wide range of lengths from 110 mm to 290 mm (4.3-11.4 in) were sampled. Over 40% of the catch measured over 23 cm (9 in), the minimum size typically harvested by anglers. (Figure 4).

Table 10. Black bullhead trap-net CPUE, PSD, RSD-P, and mean Wr for Lake Herman, Lake County, 2001-2009.

^{*5} years (1999, 2001, 2003, 2005, 2007)

All Species

White bass were first sampled in 2007 and their abundance is increasing slowly. CPUE for channel catfish and bluegill have also increased. Numbers of northern pike, and white sucker have remained relatively constant (Table 11). No common carp were captured with gill nets or trap nets, in spite of the high population estimates from the SDSU project.

MANAGEMENT RECOMMENDATIONS

- 1. Conduct annual lake surveys to monitor the fish populations.
- 2. Stock walleye fry or fingerlings as needed to fill gaps of failed natural reproduction.
- 3. Consider a habitat improvement plan that will benefit panfish and walleye reproduction, increase survival of young fish, reduce the number of rough fish, and improve water quality.

Appendix A. A brief explanation of catch per unit effort (CPUE), proportional stock density (PSD), relative stock density (RSD) and relative weight (Wr).

Catch Per Unit Effort (CPUE) is the catch of animals in numbers or in weight taken by a defined period of effort. Can refer to trap-net nights of effort, gill-net nights of effort, catch per hour of electrofishing, etc.

Proportional Stock Density (PSD) is calculated by the following formula:

PSD = Number of fish > quality length x 100 Number of fish > stock length

Relative Stock Density (RSD-P) is calculated by the following formula:

RSD-P = Number of fish > preferred length x 100 Number of fish > stock length

PSD and RSD-P are unitless and usually calculated to the nearest whole digit.

Size categories for selected species found in Region 3 lake surveys, in centimeters.

| Species | Stock | Quality | Preferred | Memorable | Trophy |
|--------------------|-------|---------|-----------|-----------|--------|
| Walleye | 25 | 38 | 51 | 63 | 76 |
| Sauger | 20 | 30 | 38 | 51 | 63 |
| Yellow perch | 13 | 20 | 25 | 30 | 38 |
| Black crappie | 13 | 20 | 25 | 30 | 38 |
| White crappie | 13 | 20 | 25 | 30 | 38 |
| Bluegill | 8 | 15 | 20 | 25 | 30 |
| Largemouth bass | 20 | 30 | 38 | 51 | 63 |
| Smallmouth bass | 18 | 28 | 35 | 43 | 51 |
| Northern pike | 35 | 53 | 71 | 86 | 112 |
| Channel catfish | 28 | 41 | 61 | 71 | 91 |
| Black bullhead | 15 | 23 | 30 | 38 | 46 |
| Common carp | 28 | 41 | 53 | 66 | 84 |
| Bigmouth buffalo | 28 | 41 | 53 | 66 | 84 |
| Smallmouth buffalo | 28 | 41 | 53 | 66 | 84 |

For most fish, 30-60 or 40-70 are typical objective ranges for "balanced" populations. Values less than the objective range indicate a population dominated by small fish while values greater than the objective range indicate a population comprised mainly of large fish.

Relative weight (Wr) is a condition index that quantifies fish condition (i.e., how much does a fish weigh for its length). A Wr range of 90-100 is a typical objective for most fish species. When mean Wr values are well below 100 for a size group, problems may exist in food and feeding relationships. When mean Wr values are well above 100 for a size group, fish may not be making the best use of available prey.
